MPB 1400 Timing Controlled Traffic Lights

Timing Controlled LED Traffic Signal System

The MPB 1400 is a remote controlled traffic signal system, which is intended for controlling alternating one-way traffic, although signal heads may be added as required to enable the control of intersections or crossroads. The settings can be adjusted by infra-red remote, which is coded to prevent unauthorised tampering. One control can be used to program any number of signal heads.

Along with the quartz mode, it is also possible to operate the controller in manual mode, with continuous red, green or flashing yellow as a warning, and lamps off for other traffic situations when manual control may be required.

The standard version of the MPB 1400 has reverse polarity, and low voltage protection, night time dimming, data buffer, (preventing data loss when changing the battery), and commercially available halogen lamps. Fitted with LED technology for long life and minimal power consumption.
